

Watchtower demo — what changed

Pedro Canário, Experience Design · 1 October 2026

The prototype now answers Aadil's and Jen's feedback on AI dashboards. Every agent run is one traceable, costed, rated **execution**, and the business impact is shown separately from the cost.

They asked	I built
Aadil — one view of every agent run, across pillars	Every run is an execution with an ID. Open it to see trigger, steps, human approval, output. One Executions list per product and across all of them.
Aadil — ROI first: cost, tokens, model, a simple rating	Cost, tokens and model on every execution. One-click "Did this help?" rating. Agent editing removed for now.
Jen — prove the business improved, not just the cost	Agent Performance split in two: what agents cost and what changed in the business , with its data source named.
Jen — the Call Checks chain	10,000 runs → 6,700 auto-updates → 38% fewer manual tracking updates. Same chain for WM and OM.
Both — a builder view with versions	Studio page for Infios builders: cost by tenant, latency, tool failures, version comparison.

Try it: open watchtower demo september 26/moonshot-prototype-standalone.html in a browser. It opens at Manager level with everything visible. Figures are illustrative.

Still open: who builds and owns this layer, and whether customers see dollar cost.
